CORP <NTT>**(72) Inventor: **SAKAMOTO MASAYUKI****(54) MOBILE COMMUNICATION SYSTEM****(57) Abstract:**

PURPOSE: To decrease the rate of an interruption time of communication due to fading attended with the movement of a mobile station by setting plural frequencies as usable frequencies and switching the operating frequency synchronously with the opposite party of communication as to the plural frequencies.

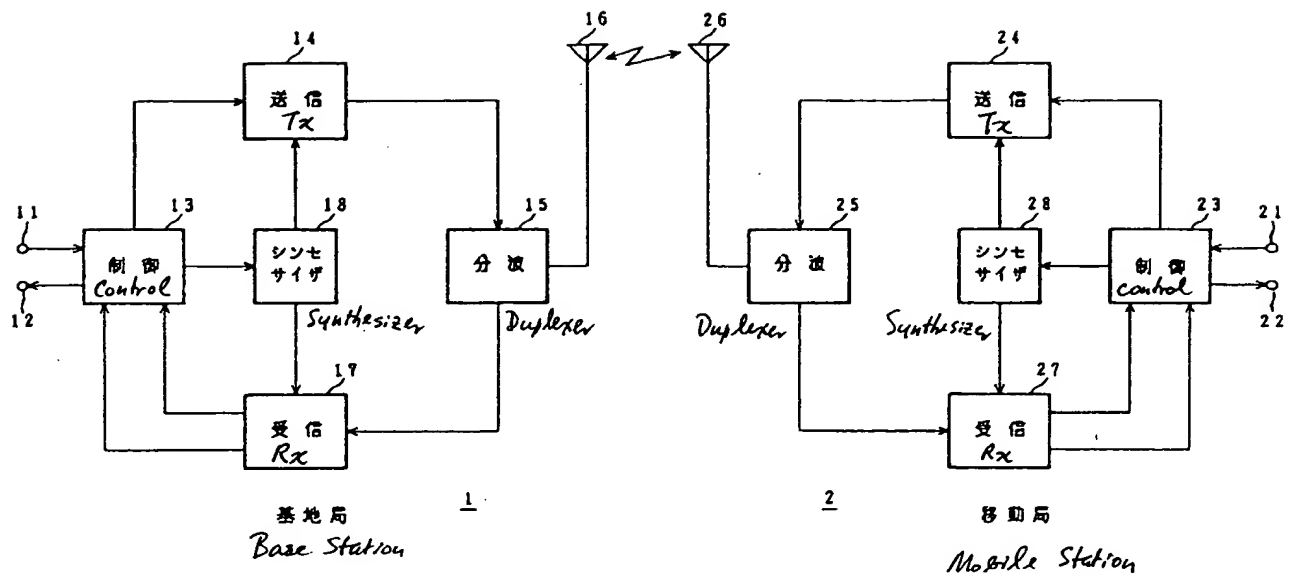

CONSTITUTION: An oscillation circuit 18 or 28 supplying a transmission frequency or a reception frequency consists of a frequency synthesizer and plural transmission/reception frequencies can be set. When a signal level is a threshold level E_s or below, the modulation of an information signal is stopped tentatively and the transmission/reception frequency is changed simultaneously to other frequency. Thus, even if a serious fading takes place at a frequency, the fact that the status of the fading differs from that at other frequency is utilized.
